Entry Information

ID:
AML.T0010.001
Type:
Sub-Technique
Name:
AI Software
URL:
https://atlas.mitre.org/techniques/AML/T0010/001/
Parent Technique:
AML.T0010
Maturity:
Realized
Created:
2021-05-13
Modified:
2026-01-29

Description

Adversaries may target software packages that are commonly used in AI-enabled systems or are part of the AI DevOps lifecycle. This can include deep learning frameworks used to build AI models (e.g. PyTorch, TensorFlow, Jax), generative AI integration frameworks (e.g. LangChain, LangFlow), inference engines, AI DevOps tools, and Model Context Protocol servers, which give AI agents access to tools and data resources. They may also target the dependency chains of any of these software packages [\[1\]][1]. Additionally, adversaries may target specific components used by AI software such as configuration files [\[2\]][2] or example usage of AI tools, which may be distributed in Jupyter notebooks [\[3\]][3].

Adversaries may compromise legitimate packages [\[4\]][4] or publish malicious software to a namesquatted location [\[1\]][1]. They may target package names that are hallucinated by large language models [\[5\]][5] (see: Publish Hallucinated Entities). They may also perform a "rugpull" in which they first publish a legitimate package and then publish a malicious version once they reach a critical mass of users [\[6\]][6].
