MITRE ATLAS | AML.T0068 - LLM Prompt Obfuscation

Entry Information

ID:
AML.T0068

Type:
Technique

Name:
LLM Prompt Obfuscation

URL:
https://atlas.mitre.org/techniques/AML/T0068/

Tactics:
AML.TA0007

Maturity:
Demonstrated

Created:
2025-03-12

Modified:
2026-01-28

Description

Adversaries may hide or otherwise obfuscate prompt injections or retrieval content to avoid detection from humans, large language model (LLM) guardrails, or other detection mechanisms.

For text inputs, this may include modifying how the instructions are rendered such as small text, text colored the same as the background, or hidden HTML elements. For multi-modal inputs, malicious instructions could be hidden in the data itself (e.g. in the pixels of an image) or in file metadata (e.g. EXIF for images, ID3 tags for audio, or document metadata).

Inputs can also be obscured via an encoding scheme such as base64 or rot13. This may bypass LLM guardrails that identify malicious content and may not be as easily identifiable as malicious to a human in the loop.
