MITRE ATLAS | AML.T0088 - Generate Deepfakes

Entry Information

ID:
AML.T0088

Type:
Technique

Name:
Generate Deepfakes

URL:
https://atlas.mitre.org/techniques/AML/T0088/

Tactics:
AML.TA0001

Maturity:
Realized

Created:
2025-10-31

Modified:
2025-11-04

Description

Adversaries may use generative artificial intelligence (GenAI) to create synthetic media (i.e. imagery, video, audio, and text) that appear authentic. These "[deepfakes](https://en.wikipedia.org/wiki/Deepfake)" may mimic a real person or depict fictional personas. Adversaries may use deepfakes for impersonation to conduct [Phishing](/techniques/AML.T0052) or to evade AI applications such as biometric identity verification systems (see [Evade AI Model](/techniques/AML.T0015)).

Manipulation of media has been possible for a long time, however GenAI reduces the skill and level of effort required, allowing adversaries to rapidly scale operations to target more users or systems. It also makes real-time manipulations feasible.

Adversaries may utilize open-source models and software that were designed for legitimate use cases to generate deepfakes for malicious use. However, there are some projects specifically tailored towards malicious use cases such as [ProKYC](https://www.catonetworks.com/blog/prokyc-selling-deepfake-tool-for-account-fraud-attacks/).
